/note="Organ: colon; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; 1st strand cDNA was prepared from colon adenocarcinoma, and was then primed with a Not I - oligo(dT) primer. Dobble-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Patima Bonaldo. "
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                              'n

polyliker; Site_1: Not I; Site_2: Eco RI; 1st strand cDNA
was prepared from human tonsillar cells enriched for
germinal center B cells by flow sorting (CD20+, 1gD-),
provided by Dr. Louis M. Staudt (NCI), Dr. David Allman
(NCI) and Dr. Gerald Marti (CBER). CDNA synthesis was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ]. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pTTT3 vector. Library went through one round of normalization, and was constructed by Bento Soares and M. Fatima Bonaldo."

Mean 34.490; Variance 153.853; scale 0.224 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This enzyme allows the microorganism to utilise 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide as its sole nitrogen source. This amidohydrolase is used in a process for a sole nitrogen source. This amidohydrolase is used in a process for the provious of 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  preparing (R)-isoforms of 3.3.3-rrifluoro-2-hydroxy-2-methyl propionamide which is cheaper than prior art optical resolution of the racemate using dimethoxy strychnine or (S)-(-)- alpha -methylbenzylamine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Enti-fluoro-2-hydroxy-2-methyl-propionic acid enantiomer preparation

PT Tri:fluoro-2-hydroxy-2-methyl-propionic acid enantiomer preparation

PT Tri:fluoro-2-hydroxy-2-methyl-propionanic acid enantiomer acid enantion and enantiomer preparation acid from Klebsiella cytoca strain PRSI. This enzyme allows the acid solated from Klebsiella cytoca strain PRSI. This enzyme allows the acid isolated from Klebsiella cytoca strain PRSI. This enzyme allows the sistemation acid introgen source. This amidohydrolase is used in a process for preparing (R) isoforms of 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide comparation (R) isoforms of 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide comparation art optical resolution of the racemate using committee.
Example 10.2; Page 29; 68pp; German.

Wav0264-WAV0275 are peptide fragments of an R-specific amidohydrolase isolated from Riebsialla oxytoca strain PRS1. This enzyme allows the microorganism to utilise 3,3 atrifluoro-2-hydroxy-2-methyl propionamide as its sole nitrogen source. This amidohydrolase is used in a process for preparing (R)-isoforms of 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide which is cheaper than prior art optical resolution of the racemate using dimethoxy strychnine or (S)-(-)- alpha -methylbenzylamine.
                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

K. Oxytoca R-specific amidohydrolase peptide T8.

R. Specific amidohydrolase; hydrolysis; racemate; nitrogen source; 3, 3, 3-trifluoro-2-hydroxy-2-methyl propionamide; isoform.

Klebsiella oxytoca.
                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

Tri:fluoro-2-hydroxy-2-methyl-propionic acid enantiomer preparation

-by stereoselectrive hydrolysis of corresponding racemic amide using

microorganism or derived enzyme, used as drug intermediate

Example 10.2; Page 29; 68pp; German.

W40264-W40275 are peptide fragments of an R-specific amidohydrolase

isolated from Klebsiella oxytoca strain PRS1. This enzyme allows the

microorganism to utilise 3,3,3 trifluoro-2-hydroxy-2-methyl propionamide

as its sole nitrogen source. This amidohydrolase is used in a process for

preparing (R)-isoforms of 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide

which is cheaper than prior art optical resolution of the racemate using

dimethoxy strychnine or (S)-(-)- alpha -methylbenzylamine.
                                                                     16-JUN-1998 (first entry)

K. oxytoca R-specific amidohydrolase peptide T9-1.

R-specific amidohydrolase; hydrolysis; racemate; nitrogen source; 3, 3, 3-trifluoro-2-hydroxy-2-methyl propionamide; isoform.
                                                                                                                                                                                                                                                                                                                                        (LONZ ) LONZA AG.

                                                                                             Example 10.2; Page 29; 68pp; German.

W40264-W40275 are peptide fragments of an R-specific amidohydrolase isolated from Klebsiella oxytoca strain PRS1. This enzyme allows the microorganism to utilise 3.3,3-trifluoro-2-hydroxy-2-methyl propionamide as its sole nitrogen source. This amidohydrolase is used in a process for preparing (R)-isoforms of 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide which is cheaper than prior art optical resolution of the racemate using dimethoxy strychnine or (S)-(-)- alpha -methylbenzylamine.
                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This engryer of the bicyclic lactamase capable of hydrolysing an enantiomer of the bicyclic lactam 2-azabicyclo(2.2.1)hept-5-en-3-one. This engryme has at least 1 of the following features; greater than 85% retention of activity after incubating at 40 deg. C for 4 hours, or 30% activity after incubating at 60 deg. C for 4 hours, or an initial concentration of 100 g racemic lactam plus 300 ml buffer and proceeding to at least 90 (especially at least 98)% hydrolysis of the (+) lactam with <5% hydrolysis of the (-) lactam. The enzyme is much more temperature-stable than previously identified (+)-gamma-lactamases carried out at very high substrate/product concentrations. This enzyme has applications as a therapeutic agent e.g. as an antiviral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ĥ

Tri:fluoro-2-hydroxy-2-methyl-propionic acid enantiomer preparation

- by stereoselective hydrolysis of corresponding racemic amide using microorganism or derived enzyme, used as drug intermediate microorganism or derived enzyme, used as drug intermediate

Example 10.2; Page 29; 68pp; German.

W40264-W40275 are peptide fragments of an R-specific amidohydrolase isolated from Klebsiella oxytoca strain PRSI. This enzyme allows the microorganism to utilise 3,3 -trifluoro-2-hydroxy-2-methyl propionamide as its sole nitrogen source. This amidohydrolase is used in a process for preparing (R)-isoforms of 3,3 -trifluoro-2-hydroxy-2-methyl propionamide which is cheaper than prior art optical resolution of the racemate using dimethoxy strychnine or (S)-(-)- alpha -methylbenzylamine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                           K. oxytoca R-specific amidohydrolase peptide T11.
R-specific amidohydrolase, hydrolysis; racemate; nitrogen source; 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide; isoform.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel mutant alpha-amylases contain a deletion or substitution of at least one asparagine residue from the wild-type. The present sequence is a specific example of such a mutant alpha-amylase from which the His residue at position 13 has been deleted. The mutant alpha-amylase is useful for starch processing and liquefaction. It is used in dishwashing or fabric-cleaning detergent compositions. The modifications produce enzymes with enhanced low pH performance suited for commercial liquefaction conditions. The mutant alpha-amylases are also found to have improved thermal and oxidative stability and to be more stable in the absence of calcium ions, compared to wild-type.

N.B. The present sequence is not shown in the specification but is derived from the Bacillus licheniformis alpha-amylase sequence shown in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   QKGTVRTKYGTKGELQSA-IKSLHSRDINVYGD-VVINHKGGADATEDVTAVEVDP-ADR 125

Tri:fluoro-2-hydroxy-2-methyl-propionic acid enantiomer preparation
- by stereoselective hydrolysis of corresponding racemic amide using
- by stereoselective hydrolysis of corresponding racemic amide using
- by stereoselective hydrolysis of corresponding racemic amide using
- by stereoselective hydrolysis of corresponding racemic amide using
- by stereoselective hydrolysis of corresponding intermediate
- by 68pp; German.
- M40264 W40275 are peptide fragments of an R-specific amidohydrolase
- isolated from Klebsiella oxytoca strain PRSI. This enzyme allows the
- microorganism to utilise 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide
- as its sole nitrogen source. This amidohydrolase is used in a process for
- preparing (R)-isoforms of 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide
- which is cheaper than prior art optical resolution of the racemate using
- dimethoxy strychnine or (S)-(-)- alpha - methylbenzylamine.
                                                                                                                                                                                                 Gaps 15;
                                                                                                                                                                                                                                                                                   28 LAM-FLQEPKKQITIVNAATAGGSMLGDVNVSAILDSFSVSYDK-RVRPNYGGPPVEVGV 85
The present sequence represents a gamma-aminobutyric acid (GABA) receptor subunit from the sheep blow fly, Lucilia cuprina. The GABA receptor subunit protein may be used to develop novel pesticides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

comprising Bacillus licheniformis enzyme having arginine, glycine
and alanine at positions 134, 310 and 320, respectively
Claim 1; Pages 7-8; 9pp; Japanese.
The present sequence is an acid stable and thermostable Bacillus
licheniformis alpha-amylase (AA), comprising the mutations 134Arg,
310Gly and 320Ala. The AA gene can be used for the recombinant
prodn. Of the mutant AA, which may be useful for investigating the
effects of specific amino acid substitutions on the enzyme's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       'note= "wild type residue substd. with Arg"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   'note= "wild type residue substd. with Gly"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A series of alpha-amylase mutants was prepared by site-directed mutagenesis at amino acid position 133. Substitution of wild-type (so this by pro, Ser, Gly or Ala (all are less hydrophobic than His) resulted in proteins with less residual activity after heating than the native enzyme. Replacement of His by Glu, Lys, Glu, Lu, phe or Tyri (increasingly more hydrophobic than His) resulted in proteins with a greater residual activity after heating than proteins with a greater residual activity after heating than his. The Tyri33 mutant had a half-life at 90 deg.C of 8 mins, c.f. of mins for the wild-type enzyme. Substitution of Ala209 by a more hydrophobic amino acid also enhances the enzyme's thermostability. When the enzyme carries mutations at both positions 133 and 209 it has a half-life at 90 deg.C that is 9-10 times greater than the native enzyme. The mutant alpha-amylases are useful in the brewing, see also Ril362.3, R34288 and R34290.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        OKGTVRTKYGTKGELQSA-IKSLHSRDINVYGD-VVINHKGGADATEDVTAVEVDP-ADR 125

                                                               Heat stable variant of Bacillus licheniformis alpha amylase with specific substitution around position 113, useful in paper mfg., brewing, etc. for starch liquefaction [Claim 2, Fig 1; 17pp; French.

The alpha-amylase protein sequence shown differs from the wild-type enzyme by having His 133 mutated to an amino acid that is more hydrophobic than His (see features). The heat stable alpha amylases are useful in textile processing, papermaking and brewing, specifically for hydrolysis (liquifaction) of starch.
                                                                                                                                                                                                                                                                                                                                                                                                              4; Gaps

CC The Matent alpha-amylases contain a deletion or substituted by a Val residue.

CC The Matent alpha-amylase is useful for starch processing and the An residue at position 209 has been substituted by a Val residue.

CC The mutant alpha-amylase is useful for starch processing and the Moofilications produce enzymes with enhanced low ph CC CMPOSITIONS. The modifications produce enzymes with enhanced low ph CC CMPOSITIC ADPA - amylases are also found to have improved thermal and oxidative conspositions. The present sequence is not shown in the specification but is Sequence to MB Tigure 4.

CC Garived from the Bacillus licheniformis alpha-amylase sequence shown in Sequence 483 AA;

Mean 48.076; Variance 94.750; scale 0.507 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 49.160; Variance 85.522; scale 0.575 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 47.366; Variance 79.598; scale 0.595 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
